

Afloat For Mac

- 1. [Afloat MacOS](#)
- 2. [Afloat Mac Mojave](#)
- 3. [Macos Keep Window On Top](#)
- 4. [Afloat Mac Catalina](#)
- 5. [Afloat For Macbook](#)

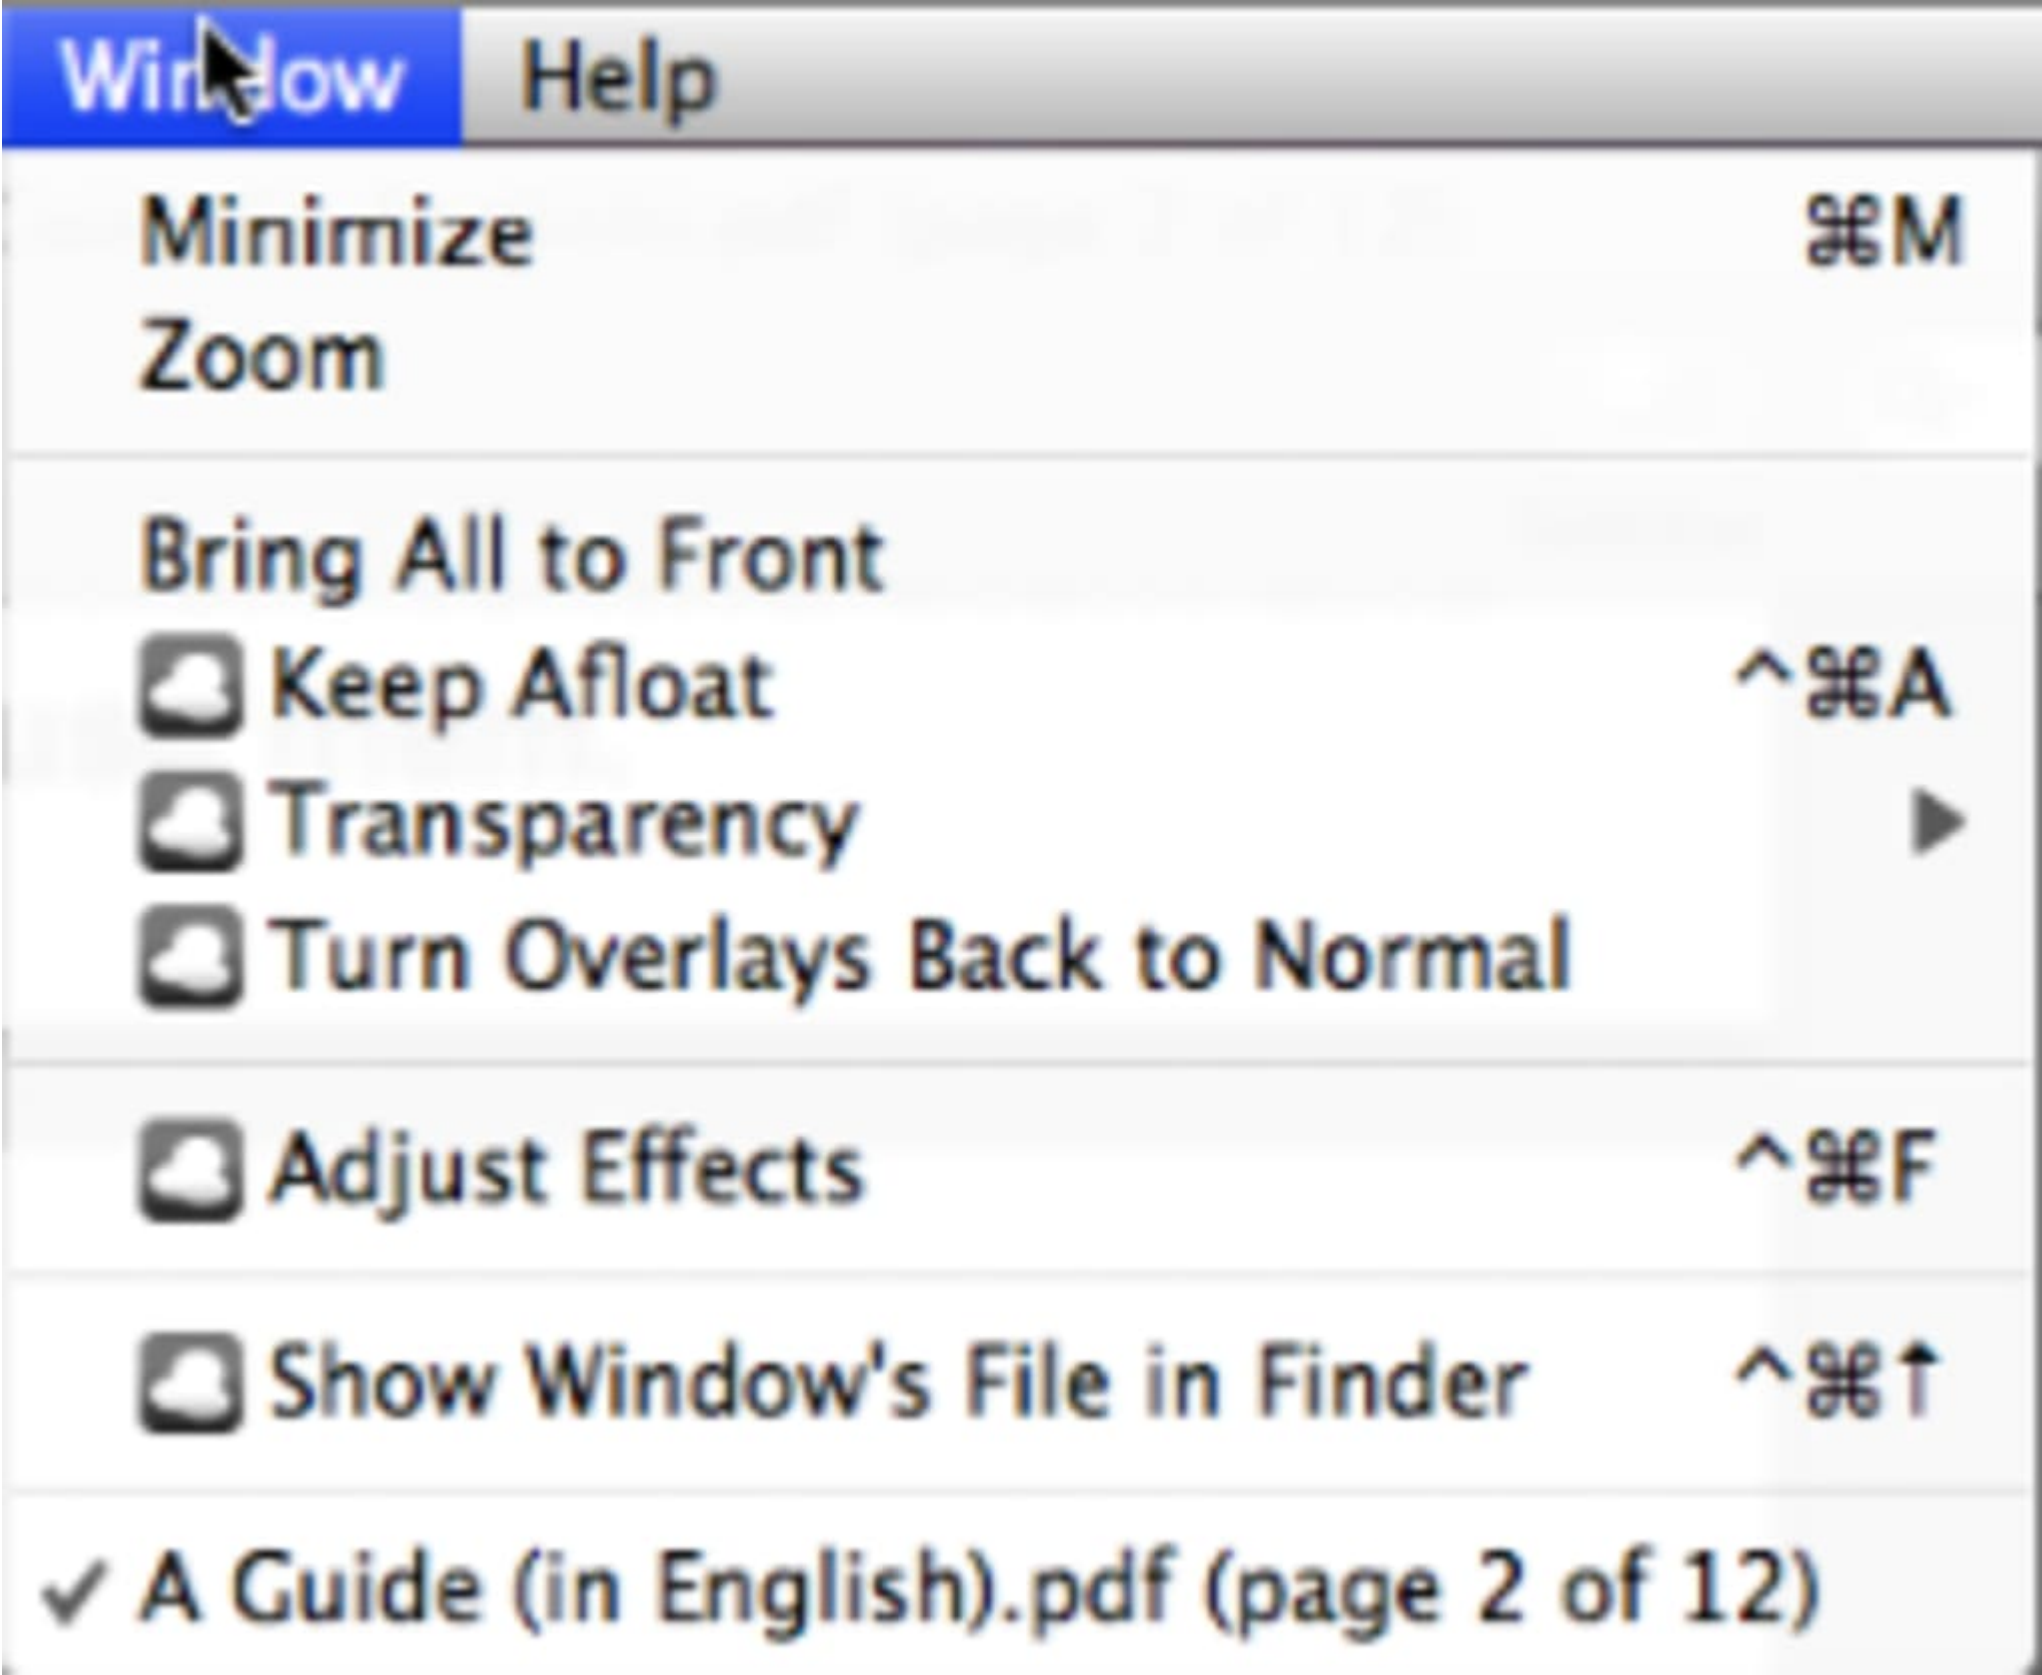

I love the Afloat Mac app, it’s a simple little app that does one thing well. Until the last couple of updates to Mac OSX that is. With the most recent update, it seems to not work at all, but that’s not the case if you know the right tweaks to make to your system.

How to fix the Afloat Mac App. Step 1 Download and install SIMBL 0.9.9 Step 2 Build rinckd’s project in Xcode (follow the first link in this post). Step 3 After building In Xcode, right click on the Afloat.bundle and ‘Show in Finder’ Step 4 Drag and drop ‘Afloat’ and “Afloat Scripting’ in to /Library/Application Support/SIMBL/Plugins. Afloat is a small extender that adds both useful window management commands and a little eye candy to most Mac applications. Afloat: - Keep windows afloat (heh) on top of all others.

There’s a decent tutorial here: <https://github.com/rinckd/afloat>

I’ve used it as a reference but found a few more steps were necessary and thought it could be explained a bit better for the novice Mac user.

[Afloat MacOS](#)

- Step 1** Download and install SIMBL 0.9.9
- Step 2** Build rinckd’s project in Xcode (follow the first link in this post).
- Step 3** After buildingIn Xcode, right click on the Afloat.bundle and ‘Show in Finder’
- Step 4** Drag and drop ‘Afloat’ and “Afloat Scripting’ in to /Library/Application Support/SIMBL/Plugins

Macos Keep Window On Top

Last step (This is the extra bit I had to do):

Afloat Mac Catalina

Restart your computer... during the reboot process, press and hold CMD+R to boot into recovery mode. Once in recovery mode, select the terminal APP from the utilities menu.

Afloat For Macbook

In terminal run:
